Project Name	Software Installation Request – ServiceNow
Maximum Marks	4 Marks

Empathy Map Canvas

An empathy map captures a user's thoughts, feelings, surroundings, actions, difficulties, and desired outcomes. The primary user for this project is an employee who needs software installed for work. The canvas summarizes the employee's likely experience during request, approval, and fulfillment.

EMPLOYEE EMPATHY MAP

Primary user: employee requesting work-related software

THINK & FEEL

- Wants the right software and version to do the job.
- Worries about approval delays or unavailable licenses.
- Wants a clear answer about when installation will happen.

HEAR

- Manager explains the business need.
- Support may request details or share updates.
- Colleagues may describe their request experience.

SEE

- A catalog form with software, version, reason, and urgency.
- Approval and fulfillment may happen behind the scenes.
- Email updates communicate the outcome.

SAY & DO

- Submits the Software Installation Request in Service Catalog.
- Provides business reason and urgency; waits for manager approval.
- May follow up if fulfillment is delayed or a license is unavailable.

PAIN

- Unclear status and repeated follow-ups.
- Approval or license delays interrupt work.

GAIN

- One consistent request channel.
- Clear ownership, updates, and installation confirmation.

Empathy Map – Explanation and Project Insights

The six areas below explain the employee's experience and show how each insight influences the ServiceNow design.

Empathy Area	What it means in this project	Design implication
Think & Feel	The employee wants software that supports their work, but may worry about approval time, license availability, and not knowing when installation will happen.	Show a clear request path and provide timely, understandable status communication.
Hear	The employee may hear requirements from a manager, questions from support staff, or advice from colleagues who have requested software.	Collect the information needed at submission so support staff do not repeatedly ask for missing details.
See	The employee sees the catalog form and any available status or email updates. The approval and fulfillment work may happen behind the scenes.	Use a structured catalog item and communicate important workflow outcomes by email.
Say & Do	The employee submits the request, enters the software name, version, business reason, and urgency, then waits for approval and fulfillment.	Make the form straightforward and ensure the request reaches the manager and support team in the right order.
Pain	Unclear progress, repeated follow-ups, approval delays, or a license shortage can interrupt the employee's work.	Track fulfillment and explain delays, including the expected one-week lead time when a new license is required.
Gain	The employee wants a simple request process, clear ownership, predictable expectations, and confirmation when the software is installed.	Send a completion email or a license-unavailable email with the relevant request details.

How the Empathy Findings Connect to the ServiceNow Project

User need or pain point	Project response
Employee needs to submit complete information.	Software Installation Request catalog item captures software name, version, business reason, and urgency.
Employee needs approval and clear responsibility.	Flow Designer sends the Requested Item to the requester's manager. After approval, a Catalog Task is assigned to Software Support Team.
Employee needs to know whether installation succeeded.	The flow waits for the Catalog Task outcome. Closed Complete follows the success email path.
Employee needs an explanation if a license is unavailable.	Pending is used in this project as the license-unavailable signal; the email explains that obtaining a new license is expected to take approximately one week.

Important note: This empathy map is a project-design hypothesis based on the workflow and user needs identified for the assignment. It is not presented as the result of formal employee interviews or a survey. The Catalog Task state Pending is used as a project-specific signal for license unavailability because On Hold was not available in the task state choices; it is not a universal definition of Pending.
