ACCEPTANCE TESTING

UAT Execution & Report Submission

Date	23 October 2026
Team ID	
Project Name	Software Installation Request (ServiceNow)
Platform / Release	ServiceNow Australia | Application scope: Global
Maximum Marks	4 Marks

1. Purpose of Document

This report records the user acceptance checks that can be supported by the supplied ServiceNow configuration screenshots and project execution details. It summarizes the tested request-submission, manager-approval, and fulfillment-task path, and identifies the notification and incident-automation scenarios that still require end-to-end execution before final release sign-off.

2. User Acceptance Testing Summary

The solution provides an employee-facing **Software Installation Request** catalog item. The requester enters the software name, version, business reason, and urgency. The requester's manager reviews the request. For an approved request, Workflow Studio creates a Catalog Task for the **Software Support Team**. The planned outcome handling monitors the task for **Closed Complete** (installation completed) or **Pending** (the project's signal that a license is unavailable).

12 **Planned checks**	**7** **Evidence-backed pass**	**0** **Recorded fail**	**5** **Not tested**

Interpretation: Seven checks are supported by visible configuration or record evidence. Five checks remain untested. "0 recorded fail" means no failed result was documented in the supplied evidence; it does not mean every workflow branch has passed.

3. UAT Scope and Acceptance Criteria

In scope	Catalog item availability; four catalog variables; RITM creation; manager approval; approved flow branch; Catalog Task creation, linkage, and assignment; outcome notifications; license-shortage Incident rule.
Acceptance criteria	A submitted request retains the requester's answers; approval is routed to the requester's manager; an approved request creates a task linked to its RITM and assigned to Software Support Team; the requester receives the correct outcome notification; a license issue creates the intended Incident.
Out of scope / not evidenced	Production email delivery, full rejection-path behavior, task-state outcome execution, and successful Incident creation were not demonstrated by the available screenshots.

The user also reported that the project was successfully verified in a second ServiceNow instance. That report is recorded as user-reported verification; it is not substituted for the specific evidence gaps listed in this UAT report.

4. Test Case Analysis

The counts below distinguish checks supported by the screenshots/record evidence from checks for which no completed execution result was supplied. No failed test result was recorded in the evidence reviewed.

Section / Validation	Total	Not tested	Fail	Pass	Validation details
Catalog item and variables	2	0	0	2	Active Software Installation Request item; four variables are listed in the configured order.
Request submission	1	0	0	1	RITM0010003 was created with the submitted software, version, reason, and urgency.
Manager approval and routing	2	0	0	2	Approval record shows Abraham Lincoln as approver and an Approved result; flow test shows the approval branch evaluated True.
Catalog Task fulfillment	2	0	0	2	SCTASK0010007 is linked to RITM0010003; task is Software Fulfillment Task and is assigned to Software Support Team.
Approval rejection path	1	1	0	0	Rejection behavior and requester communication were not demonstrated.
Task outcome notifications	3	3	0	0	Closed Complete email, Pending license-shortage email, and personalized catalog-variable values require end-to-end verification.
License-issue Business Rule	1	1	0	0	Incident creation on Requested Item state 3 (On Hold) has not been evidenced by a test execution.
TOTAL	12	5	0	7	Seven evidence-backed checks; five checks remain open.

5. Defect / Severity and Open Verification Summary

Observation / item	Severity / status	Required action before sign-off
Completion notification	Not tested	Set the created Catalog Task to Closed Complete after the flow reaches the wait action; verify the success email is generated and delivered.
License-unavailable notification	Not tested	Set the created Catalog Task to Pending after the wait action; verify the one-week license delay email is generated and delivered.
Email personalization / Get Catalog Variables	Not tested	Confirm the action inputs and selected variables; verify requester name and software name data pills appear correctly in both email bodies.
Create Incident on License Issue	Not tested	Verify Business Rule trigger/condition, caller mapping, assignment group, and that exactly one Incident is created when the RITM enters On Hold.
Approval rejection	Not tested	Submit a separate request and reject it as the manager; confirm the request reaches the intended rejected outcome and no fulfillment task is created.

Severity note: These are outstanding verification items, not confirmed defects. The supplied evidence does not establish a failed test or a production incident, so no severity rating is assigned.

6. UAT Execution Evidence

The screenshots below are selected from the project evidence supplied in this conversation. They support the passed checks listed on page 2; they do not prove the untested notification and Business Rule outcomes.

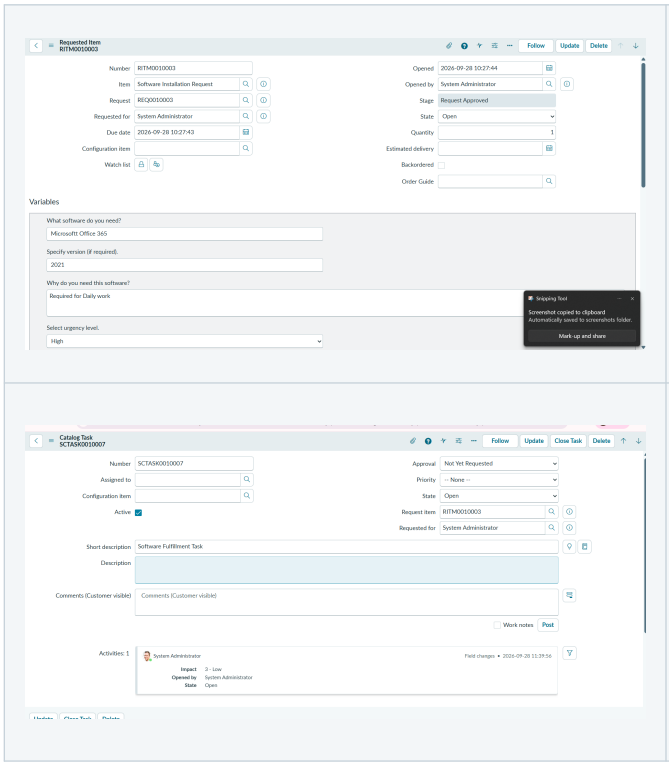

Figure 1. RITM0010003 shows the submitted Microsoft Office 365 request, version 2021, business reason "Required for Daily work," and urgency High.

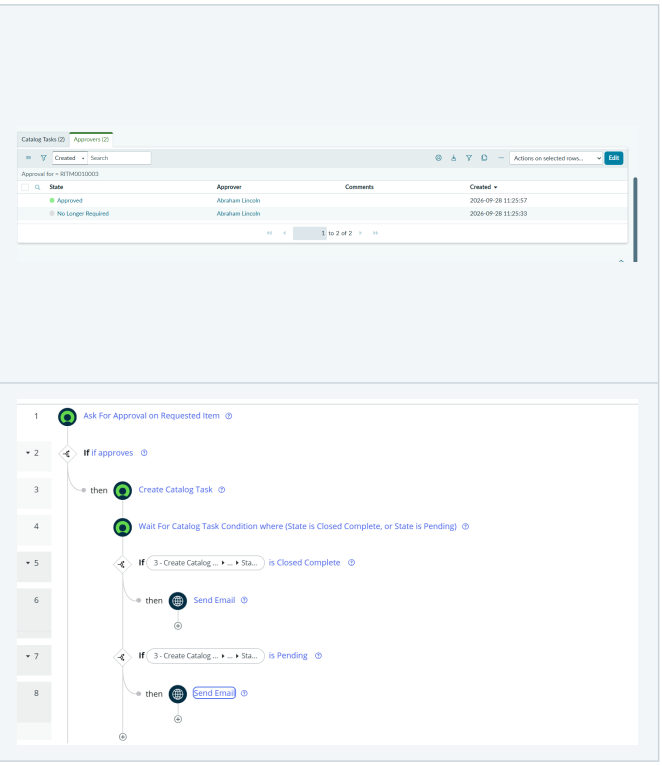

Figure 2. Approval records for RITM0010003 show Abraham Lincoln with an Approved approval entry.

Figure 3. SCTASK0010007 is linked to RITM0010003 and displays the Software Fulfillment Task details.

Figure 4. Workflow Studio shows the approved branch, Catalog Task creation, wait condition, and the two outcome email branches.

7. Execution Result and Release Recommendation

Evidence-backed result: The catalog item is active and configured with four variables; a submitted request and its variable values are visible on RITM0010003; an approval record shows Approved; the workflow test evidence shows the approved branch evaluating True; and SCTASK0010007 was created and linked to the requested item for Software Support Team fulfillment.

Deployment evidence: The update set *Software Installation Request Setup* was committed successfully (100% succeeded, 12 updates, zero collisions), as recorded in the project documentation.

Design distinction: The workflow monitors the Catalog Task [sc_task]. For this project, Pending is used as the license-unavailable signal because it was the available task state selected by the user; this is a project convention, not a universal definition of Pending. The separate Business Rule runs on Requested Item [sc_req_item] and checks state value 3 (commented as On Hold). These are different records and states.

Recommendation: Accept the demonstrated catalog submission, approval, and task-creation portion as evidence-backed. Do not record final end-to-end UAT sign-off yet. Complete the five untested scenarios, especially the two task-state emails, Get Catalog Variables personalization, rejection behavior, and license-issue Incident creation; then attach the resulting execution evidence and retest any failures.

Report basis: ServiceNow Australia project configuration and screenshots supplied by the user; the project's final report details; and the UAT reference/template provided for this submission. Unverified behavior is explicitly marked as Not tested.
